Free Memory Screen Offered to Encourage Early Detection of Alzheimer's Disease

Irvine, CA, November 1, 2006— Medical Care Corporation announced today that, in conjunction with National Alzheimer's Disease Awareness Month in November, the company's online Memory Screen will be available free of charge. Individuals can assess their memory, or the memory of a loved one, with this free test offered at www.PreventAD.com. Doing so could make them aware of any developing memory loss and contribute to earlier detection of Alzheimer's disease. Earlier detection can lead to more timely intervention by a physician which can significantly improve one's quality of life for several years.

Currently, up to 95% of Alzheimer's patients are not diagnosed until the disease has progressed to a moderate or severe stage of dementia. Just like diabetes, heart disease and many other conditions, treating Alzheimer's disease at its earliest stage is most beneficial. Although it is not widely appreciated, early detection and proper treatment can delay the progression of Alzheimer's disease by approximately 50% and can yield several additional years of independence.

"Making the Memory Screen available for free to the general public will facilitate earlier detection of memory disorders," said Dennis Fortier, CEO of Medical Care Corporation. "Individuals who have a memory concern can complete the Memory Screen and share the results with their physician. If any memory loss is identified, the physician can then pursue further testing in order to diagnose and treat the underlying problem."

The Memory Screen is a subjective questionnaire that can be completed anonymously in 10-15 minutes in the privacy of one's home by visiting www.preventAD.com. It is deceptively simple but is scored with sophisticated mathematical analysis that is 94% accurate in differentiating mild dementia from normal aging. While the Memory Screen is a subjective evaluation and cannot replace the objective tests used by physicians, it is more accurate than conventional paper tests which are scored with rudimentary methods.

About Medical Care Corporation

Medical Care Corporation specializes in the development of medical technologies that enable healthcare providers to deliver improved levels of care in the field of dementia. Medical Care Corporation's electronic dementia care system gathers, organizes, and synthesizes patient and treatment information so that healthcare providers are equipped to provide care at the highest possible level. The company's MCI Screen is 97.3% accurate in distinguishing a pre-dementia stage called mild cognitive impairment (MCI) from normal aging. The company is also a leader in communicating the value of prevention and early detection to patients and caregivers through its website and educational materials. Additional information about the company is available at two websites: Health care providers: www.mccare.com; Patients and Caregivers: www.preventad.com.
